

## **JAVA PROJECT ABSTRACT**

File transfer is a very important part of anyone using a computer. It's important to transfer files to share data and other resources. The use of external devices for transferring files makes the task slightly tedious. Thus, arose the era of wireless transfer.

The project **File Transfer** is designed to copy files from one computer to another using the powerful Java language. RMI is used to establish connection between the two systems. File pointers are used to point to the required files and a byte object is used to move the data byte by byte. The application is more than two hundred times faster than applications using Bluetooth for transfer.
